

Sara works at a hospital in Florida. Her  
city is about to be hit by a hurricane and  
many citizens arriving at the hospital are  
not sick or injured.

Sara needs a way to identify non-pa-  
tients and to keep track of them.

When non-injured people arrive, they  
register at the front desk and receive a  
bracelet that responds to sensors in the  
room. This lets staff keep track of them.

Sara is now able to monitor everyone  
at the hospital by simply checking the  
computer. In case she needs to talk to  
a specific person, that person's bracelet  
will blink, indicating they need to go to  
the front desk.
